

MESH streamlines all quality projects and engineering documentation in one easy-to-use system. Integrating production quality reporting and APQP project management allows organizations to manage new product launches, ongoing production, and manufacturing efficiently and transparently with relevant stakeholders. MESH facilitates strong collaboration across quality, sales, production, design engineering, and project management.

Incident Reporting

Even the most minor quality issue can affect the successful launch of a project. If it takes days for important stakeholders to find out, it can affect an organization's bottom line.

Do you know what is happening in your factory at any given time?

When issues arise on a specific machine, part, cell, or plant – how soon do you find out?

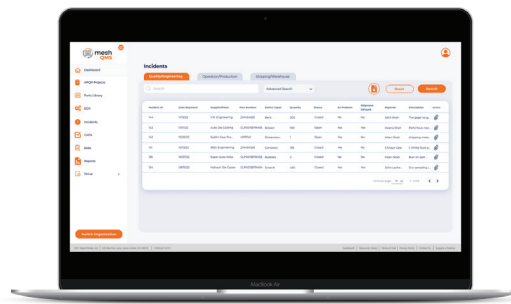

Are all quality issues documented and stored in a central location?

Do you know which incidents affect delivery?

How long does it take you from the time an incident occurs to report said incident?

MESH Quality Incident Reporting Answers These Questions & More

Production team members, quality engineers, inspectors, and process engineers can **quickly report any incident with an easy-to-use mobile app**. It allows quick documentation, recording, and escalation of a quality incident, including quantity affected, plant location, defect type, and pictures/videos of the affected part(s). As users on the ground report incidents, all relevant stakeholders of a part or the APQP project are notified by email and notification to keep the entire team up to speed.

Easily report any incident in the field with relevant information

View all your incidents from all your factories/plants in one place

APQP (New Product Development)

One of the biggest challenges in launching projects is sharing relevant information, controlled documents, milestones, and lack of a clear process.

How do you know what is going on with an NPD project?

How do you keep track of multiple projects at once they are on track to launch?

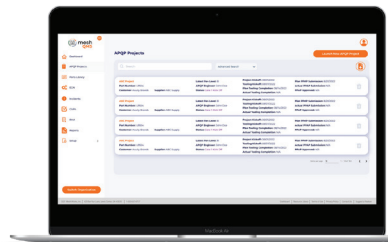

How many projects are your engineers working on at a given time?

How do you share and collaborate on detailed engineering drawings and control documents?

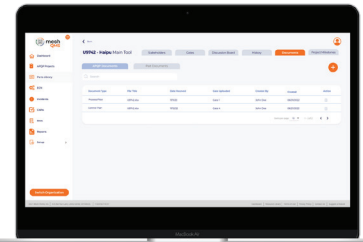

How do you manage customer checkpoints and requirements for project tracking?

Solve all of These Challenges and More with MESH APQP

MESH APQP allows manufacturing companies to organize their new product development projects and **streamline all engineering and APQP processes and documentation into one place**. This allows visibility to all stakeholders across different departments - from sourcing & purchasing to quality, NPD, and engineering.

Track all your quality projects with relevant stakeholders involved
